# Dynamic Re-ordering in Mining Top-k Productive Discriminative Patterns 

Yoshitaka Kameya* and Ken'ya Ito Meijo University

- Background
- Dynamic re-ordering in mining top- $k$ productive discriminative patterns
- Experiments
- Related work and Conclusion

## Outline

- Background
- Dynamic re-ordering in mining top-k productive discriminative patterns
- Experiments
- Related work and Conclusion

## Background: Discriminative Patterns (1)

- Discriminative patterns:
- Show differences between two groups (classes)
- Used for:
- Characterizing the positive class
- Building more precise classifiers

Discriminative pattern $\boldsymbol{x}$

## Background: Discriminative Patterns (2)

- Discriminative patterns tend to be more meaningful than frequent patterns (thanks to class labels)
- Are class labels always available?
- Comparing groups is a standard (and promising) starting point in data analysis
- Clustering can find groups (classes)! $\rightarrow$ Cluster labeling

Clusters labeled with

## Background: Discriminative Patterns (3)

- Quality score: Measures the overlap between pattern $\boldsymbol{x}$ and positive class $c$

Quality is high

Quality is low

- Most of popular quality scores are not anti-monotonic: - Confidence, Lift
- Support difference, Weighted relative accuracy, Leverage
- F-score, Dice, Jaccard
$\rightarrow$ Branch \& bound pruning is often used [Morishita+ 00][Zimmermann+ 09][Nijssen+ 09]

## Background: B\&B Pruning for Top- $k$ Patterns

- Suppose: we are visiting a pattern $x$ in a depth-first search
- We compute the upper bound $U(\boldsymbol{x})$ of its quality $R(\boldsymbol{x})$ ( $U(x)=$ an optimistic estimate of qualities of $x^{\prime}$ s extensions)
- We prune the subtree below $\boldsymbol{x}$ if $U(\boldsymbol{x})<R(\boldsymbol{z})$, where $z$ is the $k$-th candidate

Candidate list
for tentative top-k patterns

Prune the subtree below $\boldsymbol{x}$

$$
\text { if } U(x)<R(z) \text { ! }
$$

Optimistic estimate:

## Background: Suffix Enumeration Trees (1)

## Background: Suffix Enumeration Trees (1)

- Beneficial for checking the productivity constraint in a depth-first search

Productivity constraint: Every pattern must not be of less quality than its sub-pattern

Suffix enumeration tree:

## Background: Suffix Enumeration Trees (1)

- Beneficial for checking the productivity constraint in a depth-first search

## Prefix enumeration tree:

$\rightarrow$ NOT "Sub-patterns first" $\varnothing$

ABCD
Suffix enumeration tree:
$\rightarrow$ "Sub-patterns first"
"Sub-patterns first" property:
When visiting a pattern $x$, we have already visited all sub-patterns of $x$

## Background: Suffix Enumeration Trees (2)

- Also beneficial for effective B\&B pruning

Suffix enumeration tree:

Candidate list

Suppose: $\mathrm{A}=$ the highest quality item,
$B=$ the $2^{\text {nd }}$ highest quality item, $\mathrm{C}=$ the $3^{\text {rd }}$ highest quality item,
$\rightarrow$ Items of higher quality are combined earlier
$\rightarrow$ Patterns of higher quality would be visited earlier

B\&B pruning would be more aggressive!

We prune the subtree below $x$ if $U(x)<R(z)$
$\rightarrow$ Threshold in $\mathrm{B} \& \mathrm{~B}$ pruning is higher if $z$ has a higher quality

## Outline

## $\checkmark$ Background

- Dynamic re-ordering in mining top- $k$ productive discriminative patterns
- Basic idea
- Justification
- Experiments
- Related work and Conclusion

## Outline

## $\checkmark$ Background

- Dynamic re-ordering in mining top- $k$ productive discriminative patterns
- Basic idea
- Justification
- Experiments
- Related work and Conclusion

## Our proposal: Basic idea (1)

## - Basic idea:

Re-order sibling patterns dynamically according to their qualities
$\rightarrow$ Patterns of higher quality will be visited yet earlier
$\rightarrow$ B\&B pruning will be yet more aggressive

## Our proposal: Basic idea (2)

## - Example:

- 10 transactions
- Quality is measured by F-score

|  | Dataset |  |
| :---: | :---: | :---: |
|  | Class | Transaction |
| Positive | + | \{A, B $\}$ |
|  | + | $\{\mathrm{A}, \mathrm{C}, \mathrm{E}\}$ |
|  | + | $\{\mathrm{A}, \mathrm{D}\}$ |
|  | + | $\{B, C, E\}$ |
|  | + | $\{\mathrm{B}, \mathrm{D}\}$ |
| Negative | - | $\{A, B, C\}$ |
|  | - | $\{\mathrm{B}, \mathrm{E}\}$ |
|  | - | $\{\mathrm{C}, \mathrm{D}\}$ |
|  | - | $\{C, D, E\}$ |
|  | - | \{E\} |

## Our proposal: Basic idea (4)

## - Example:

- 10 transactions
- Quality is measured by F-score

Recall of $\{A\}=3 / 5=0.6$
Precision of $\{\mathrm{A}\}=3 / 4=0.75$

$$
\begin{aligned}
& \text { F-score of }\{A\}= \\
& 2 * 0.6 * 0.75 /(0.6+0.75)=0.67
\end{aligned}
$$

- Similarly, we have:
- F-score of $\{A\}=0.67$
- F-score of $\{B\}=0.6$
- F-score of $\{C\}=0.4$
- F-score of $\{D\}=0.44$
- F -score of $\{\mathrm{E}\}=0.4$

|  | Dataset |  |
| :---: | :---: | :---: |
|  | Class | Transaction |
| Positive $\{$ | + | $\{\mathrm{A}, \mathrm{B}\}$ |
|  | $+$ | $\{A, C, E\}$ |
|  | $+$ | $\{A, D\}$ |
|  | + | $\{B, C, E\}$ |
|  | $+$ | $\{\mathrm{B}, \mathrm{D}\}$ |
| Negative | - | $\{\mathrm{A}, \mathrm{B}, \mathrm{C}\}$ |
|  | - | $\{\mathrm{B}, \mathrm{E}\}$ |
|  | - | $\{\mathrm{C}, \mathrm{D}\}$ |
|  | - | $\{C, D, E\}$ |
|  | - | \{E\} |

Static ordering among patterns:

$$
\mathrm{A}<\mathrm{B}<\mathrm{D}<\mathrm{C}<\mathrm{E}
$$

## Our proposal: Basic idea (4)

## - Example:

- 10 transactions
- Quality is measured by F-score

|  | Dataset |  |
| :---: | :---: | :---: |
|  | Class | Transaction |
| Positive | + | $\{\mathrm{A}, \mathrm{B}\}$ |
|  | + | $\{A, C, E\}$ |
|  | + | $\{\mathrm{A}, \mathrm{D}\}$ |
|  | + | $\{\mathrm{B}, \mathrm{C}, \mathrm{E}\}$ |
|  | + | $\{\mathrm{B}, \mathrm{D}\}$ |
| Negative $\{$ | - | $\{\mathrm{A}, \mathrm{B}, \mathrm{C}\}$ |
|  | - | $\{\mathrm{B}, \mathrm{E}\}$ |
|  | - | $\{\mathrm{C}, \mathrm{D}\}$ |
|  | - | $\{C, D, E\}$ |
|  | - | \{E\} |

(Note)
Patterns that do not appear in the dataset are hidden
"Sub-patterns first" property holds and we have productive patterns $\{A\},\{B\},\{C, E\},\{D\},\{C\},\{E\}$

## Our proposal: Basic idea (4)

## - Example:

- 10 transactions
- Quality is measured by F-score

## Suffix enumeration tree

 with dynamic re-ordering:

|  | Dataset |  |
| :---: | :---: | :---: |
|  | Class | Transaction |
| Positive | $+$ | \{A, B |
|  | + | $\{\mathrm{A}, \mathrm{C}, \mathrm{E}\}$ |
|  | $+$ | $\{\mathrm{A}, \mathrm{D}\}$ |
|  | + | $\{B, C, E\}$ |
|  | + | $\{\mathrm{B}, \mathrm{D}\}$ |
| Negative | - | $\{\mathrm{A}, \mathrm{B}, \mathrm{C}\}$ |
|  | - | $\{\mathrm{B}, \mathrm{E}\}$ |
|  | - | $\{\mathrm{C}, \mathrm{D}\}$ |
|  | - | $\{C, D, E\}$ |
|  | - | \{E\} |

## Outline

## $\checkmark$ Background

- Dynamic re-ordering in mining top- $k$ productive discriminative patterns

$\checkmark$ Basic idea<br>- Justification

- Experiments
- Related work and Conclusion

## Our proposal: Justification (1)

- "Sub-patterns first" property is assured even with dynamic re-ordering
- Key observation:

Visiting order of a search =
ヨtopological order over a Hasse diagram $\Rightarrow$ The search is "sub-patterns first"

## Our proposal: Justification (2)

- "Sub-patterns first" property is assured even with dynamic re-ordering
- Key observation:

Visiting order of a search =
ヨtopological order over a Hasse diagram $\Rightarrow$ The search is "sub-patterns first"

## Our proposal: Justification (2)

- "Sub-patterns first" property is assured even with dynamic re-ordering
- Key observation:

Visiting order of a search =
ヨtopological order over a Hasse diagram
$\Rightarrow$ The search is "sub-patterns first"

## Our proposal: Justification (2)

- "Sub-patterns first" property is assured even with dynamic re-ordering
- Key observation:

Visiting order of a search =
ヨtopological order over a Hasse diagram
$\Rightarrow$ The search is "sub-patterns first"

## Our proposal: Justification (2)

- "Sub-patterns first" property is assured even with dynamic re-ordering
- Key observation:

Visiting order of a search =
ヨtopological order over a Hasse diagram $\Rightarrow$ The search is "sub-patterns first"

| A | Stack |
| :---: | :---: |
| B |  |
| AB |  |
| C |  |
| AC |  |
| BC |  |
| ABC |  |
| D |  |
| AD |  |
| BD |  |
| ABD |  |
| CD |  |
| ACD |  |
| BCD |  |
| ABCD |  |

## Our proposal: Justification (2)

- "Sub-patterns first" property is assured even with dynamic re-ordering
- Key observation:

Visiting order of a search =
ヨtopological order over a Hasse diagram
$\Rightarrow$ The search is "sub-patterns first"
Suffix enumeration tree with a static ordering A $<\mathrm{B}<\mathrm{C}<\mathrm{D}<\mathrm{E}$ :

|  |
| :---: |
| $A$ |
| $B$ |
| $A B$ |
| $C$ |
| $A C$ |
| $B C$ |
| $A B C$ |
| $D$ |
| $A D$ |
| $B D$ |
| $A B D$ |
| CD |
| $A C D$ |
| $B C D$ |
| $A B C D$ |

## Our proposal: Justification (3)

- "Sub-patterns first" property is assured even with dynamic re-ordering
- We can always consider a topological sorting that simulates our dynamic re-ordering

|  |
| :---: |
| A |
| B |
| AB |
| y C |
| BC |
| AC |
| S Stack |
|  |
| D |
| AD |
| CD |
| ACD |
| BD |
| BCD |
| ABD |
| ABCD |

## Our proposal: Justification (4)

- Topological sorting over a Hasse diagram also help us justify a "sub-patterns first" enumeration tree for sequence patterns:

To build this enumeration tree, we extend $x$ whose lastly added item is $u$ as follows:

- Insert items $u$ or $x$ such that $x<u$ in the ascending order w.r.t. <
- When inserting $x$, insert it everywhere outside/between the items in $\boldsymbol{x}$
- When inserting $u$, insert it on the left side of the lastly added $u$
- SPADE-like algorithm using a vertical layout can work with this tree, though max-gap constraint does not hold monotonically

## Experiments: Settings

- Target: 16 datasets preprocessed by the CP4IM project:

| Dataset | \#Trans. | \#Items |
| :--- | ---: | ---: |
| anneal | 812 | 93 |
| audiology | 216 | 148 |
| australian-credit | 653 | 125 |
| german-credit | 1,000 | 112 |
| heart-cleveland | 296 | 95 |
| hepatitis | 137 | 68 |
| hypothyroid | 3,247 | 88 |
| kr-vs-kp | 3,196 | 73 |

| Dataset | \#Trans. | Items |
| :--- | ---: | ---: |
| lymph | 148 | 68 |
| mushroom | 8,124 | 110 |
| primary-tumor | 336 | 31 |
| soybean | 630 | 50 |
| splice-1 | 3,190 | 287 |
| tic-tac-toe | 958 | 28 |
| vote | 435 | 48 |
| zoo-1 | 101 | 36 |

- We compare 3 variants of FP-growth with:
- Static ordering based on quality (Static)
- Static random ordering (Random)
- Dynamic re-ordering (Dynamic; the proposed method)

## Experiments: Results (1)

- Number $k$ of output patterns $=1$ (lightweight cases)

| Dataset | Entire \# of visited patterns |  |  |  |  |
| :--- | :---: | ---: | :---: | ---: | ---: |
|  | Static | Dynamic | Random | Reduction <br> ratio | $\begin{array}{l}\text { Reduction ratio } \\ \text { ( }\end{array}$ (Static $\rangle-\langle$ (Dynamic $\left.\rangle\right) /\langle$ Static $\rangle$ |

## Experiments: Results (2)

- Number $k$ of output patterns = 1 (lightweight cases)

| Dataset | Running time (sec) |  |  |  | Reduction ratio $=(\langle$ Static $\rangle-\langle$ Dynamic $\rangle) /\langle$ Static $\rangle$ |
| :---: | :---: | :---: | :---: | :---: | :---: |

## Outline

## $\checkmark$ Background

$\checkmark$ Dynamic re-ordering in mining top-k productive discriminative patterns
$\checkmark$ Basic idea
$\checkmark$ Justification
$\checkmark$ Experiments

- Related work and Conclusion

## Related work and Conclusion

- "Sub-patterns first" property was firstly introduced in selecting frequent minimal generators [Li+ 06]
- Dynamic re-ordering itself has been introduced in:
- OPUS [Webb 95]
- SD-Map* [Atzmueller+ 09]
- This work's originality: productivity constraint + dynamic re-ordering
- Formally justified using the notion of topological sorting over a Hasse diagram
- Empirically supported by experiments

## Thank you for your attention!

## Implementation (1)

- We re-order the items in the header table and conditional transactions while building a FP-tree

## Implementation (2)

- We re-order the items in the header table and conditional transactions while building a FP-tree (cont'd)

## Implementation (3)

- We re-order the items in the header table and conditional transactions while building a FP-tree (cont'd)

Inherit the positive/negative counts in leaves

## Implementation (4)

- We re-order the items in the header table and conditional transactions while building a FP-tree (cont'd)

| Header Table |  |  |  |
| :---: | :---: | :---: | :---: |
| Item | + | - | F-score |
| A | 1 | 0 | 0.67 |
| B | 1 | 1 | 0.60 |
| C | 2 | 1 | 0.40 |

Initial order:
A $<$ B $<$ D $<C<E$

Conditional transactions

## Implementation (5)

- We re-order the items in the header table and conditional transactions while building a FP-tree (cont'd)

| Header Table |  |  |  |
| :---: | :---: | :---: | :---: |
| Item | + | - | F-score |
| A | 1 | 0 | 0.33 |
| B | 1 | 1 | 0.29 |
| C | 2 | 1 | 0.50 |

Conditional order on $\{E\}$ :

$$
C<A<B
$$

Conditional transactions

## Implementation (6)

- We re-order the items in the header table and conditional transactions while building a FP-tree (cont'd)

Re-order

Conditional order on $\{E\}$ :
$C<A<B$

Conditional transactions

## Implementation (7)

- We re-order the items in the header table and conditional transactions while building a FP-tree (cont'd)

## Implementation (8)

- We re-order the items in the header table and conditional transactions while building a FP-tree (cont'd)

| Header Table |  |  |  |
| :---: | :---: | :---: | :---: |
| Item | + | - | F-score |
| C | 2 | 1 | 0.50 |
| A | 1 | 0 | 0.33 |
| B | 1 | 1 | 0.29 |

Conditional order on $\{\mathrm{E}\}$ :

$$
C<A<B
$$
